

Agent Action Manifest

People set authority. Agents request. The trusted gate governs each action.

Diagram PDF pages 2 and 3
detail results and restrictions.
Detection remains host-owned.

Budgets and feedback can restrict actions, never expand authority. Restoration requires an authorized owner.

Results at the trusted gate

A receipt, an observation and a reconciliation result answer different questions. No returned value is permission to repeat an action.

Aggregate budgets and governed restrictions

The fast loop applies existing rules. The slower improvement loop changes software or policy only through reviewed, versioned release.

A FAST PROTECTION UNDER REVIEWED RULES

B AUTHORIZED RESTORATION AND HOST RESPONSIBILITIES

C REVIEW TEST APPROVE AND RELEASE

This bottom row is the human/deployer-owned improvement workflow. The reference supplies case extraction, not an automated deployment pipeline.

Standing authority never expands through feedback.
A successful reconciliation or verified outcome changes the action's evidence/state. It does not clear an operational hold. Restoration and reviewed release are separate paths.

Source: audit.py, aggregate.py, feedback.py, managed_gate.py and v4.py. Host authentication, evidence, detectors and campaign restoration safeguards remain deployment responsibilities.
